## **XOne Assist**

The natural  
programming based  
on Machine Learning

We start the year 2019 by introducing XOne Assist, our programming Virtual Assistant based on augmented development and continuous machine learning.

It allows the apps development through non-traditional programming tools. In particular, our agent is created to leverage programming interactions very close to everyday tasks.

The combination of these AI methodologies allows to bring the apps development closer to new users with no previous great requirements, and raise complex solutions for the most experienced users which, certainly, it will generate a high level of productivity and competitiveness to the IT companies.

XOne drives innovation again in mobile developments, within a field in which we are the leaders, where we have been trusted for years by more than 200 large companies in which more than 100,000 devices are daily working on XOne.

We invite you to explore how XOne technology can change the way we work!!.

Sincerely,

XOne Marketing Team
